Private team learning in agentic AI

A guide for learning and development leaders and engineering sponsors planning a team programme with Sunil Mathew.

Start with a decision the team owns

A product team might need to decide when an agent may use a tool. An architecture group might need a consistent way to review evaluation results. Pick one decision and identify the people who will be expected to make it after the programme.

Choose a format

Production Week brings together up to ten people in a role-specific cohort. The format is five four-hour live sessions over one to two weeks. Discuss the schedule, readiness review and follow-up with Sunil.

A private team programme suits groups that need practice across several design decisions. The sponsor and Sunil agree the audience, working example, independent work and review criteria during scoping.

What the team can practise

- Define evaluation cases for a representative workflow, including inputs where the system should ask for help.
- Specify what an agent may do independently and which actions require human approval.
- Review the evidence together and identify the next test or design change.

What to bring to a scoping call

Bring the participant roles and approximate group size, one workflow, and a target date or planning cycle. A reference example can stand in for sensitive company material. The written proposal sets the scope, fee and delivery arrangements.

Request a scoping call
